

DID YOU KNOW?

Each year about 12.5 million tonnes of plastic is made from fossil fuels

DID YOU KNOW?

More than 30% of this plastic is used for short-lived packaging products

DID YOU KNOW?

Over 50% of the light packaging materials from household collections consist of plastic

We believe that recycled plastic playground products brings with it a responsibility to educate children about the importance of recycling and to continue to develop new innovative products with recycled material.

By mechanically recycling plastic from household and industrial collections, we are actively contributing to the protection of our environment and its finite resources.

Compared to conventional processes, mechanical recycling ("turning old into new") has proven to be especially eco-efficient and CO2 reductive. By manufacturing products from 100% recycled plastic, it is in many cases diverting this waste going to landfill.

Finished products made from recycled plastic are also highly eco-friendly. Being chemically inert, they do not contaminate the environment in which they are used. They are made from 100% recycled plastic and are also 100% recyclable. They are extremely cost effective as their durability and long life eliminates any maintenance or replacement costs, which further adds to the protection of our environment.
